-----

This study conducts a cost-benefit analysis of replacing forest land with a large-scale solar (LSS) photovoltaic (PV) facility, using data from a proposed 9.35 MW DC project in the ...

Developers see trees that can be cut down to make way for acres of solar panels, providing carbon-free electricity. Environmentalists see a natural landscape that sequesters huge ...

Research simulating a solar tree farm within a coastal forest in South Korea found that solar tree structures could preserve 99% of forest cover when compared to a fixed solar farm built...

Unlike rooftop PV systems, which have limited or no land-use impacts by virtue of being mounted on existing structures, utility-scale PV plants are, by definition, sited on the ground and in the landscape ...

natural resource values, wildlife habitat, and cultural resources. Through upfront land use planning and appropriate levels of environmental review, the BLM can ensure the responsible development of ...

Study reveals "solar trees" can match the power of a conventional solar farm while preserving up to 99% of forest cover.

Solar trees, simulated in Google Earth, presented visual evidence that the forest can absorb carbon from the atmosphere and make it possible to generate electricity at the same time.

New research shows that common solar datasets underestimate land use by up to 34% because they ignore the footprint of the entire facility. ...

Solar energy expansion often comes at the cost of forest destruction, creating fundamental conflicts between renewable energy goals and ecosystem preservation. Here, we ...
