---

On average, a humble wind turbine uses less land area per megawatt-hour than almost any other power source. Even so, a wind turbine ...

As the kite glides and maneuvers across the sky, its movements pull the tether, which in turn drives the generator to produce electricity. This efficient ...

A single kite power unit can potentially generate as much electricity as a much larger conventional wind turbine while occupying only a fraction of the land area.

Makani, a company owned by Google's parent, Alphabet, is developing a renewable energy kite that can harness wind power to produce ...

The physics behind kites flying at higher altitudes to generate clean energy must be remembered and noted. Using the principles of physics, the ...

First, let us understand how the latest energy kite would work. It is made from lightweight carbon fiber, docked at a tower, and when the wind ...

Makani set out to unlock access to new sources of clean, affordable wind power by developing novel energy kite technology. Over 13 years, the team developed kites that flew in loops to generate ...

Flying massive kites 200 meters or more above the ground, companies are using the wind they find there to generate electricity. At least 10 ...

One such groundbreaking development is the flying wind turbine by KiteKRAFT, a German startup that has successfully tested a kite-like device ...
