Figures shown in the following section reflects changes on load, net load, and their ramps, which are the main result derived from the application of our methodology and highlights the ...

Techno-Economic Feasibility Analysis through Optimization Strategies and Load Shifting in Isolated Hybrid Microgrids with Renewable Energy for the Non-Interconnected Zone (NIZ) of Colombia

As Colombia accelerates its energy transition, the country faces a complex challenge: how to maintain grid reliability while integrating more ...

The ongoing energy transition in Colombia is marked by three main developments: (1) the massive integration of Inverter-Based Resources (IBRs) and distributed ...

Modelling and simulation were performed considering storage systems based on lithium and lead-acid batteries. The resulting simulations provide the optimal system cost, emissions levels, electricity cost ...

Colombia Visa Crisis: Navigating a Shifting Alliance & Rising Security RisksAs UK citizens increasingly seek residency in Colombia, a complex web of bureaucratic hurdles, evolving security ...

To break their reliance on dirtier grids, tech giants are looking for opportunities to shift daily or even hourly data center operations around the ...

In developing countries, electrification in remote areas, where access to energy is limited or null, has been one of the biggest challenges in recent years. Isolated microgrids with renewable...

In the so-called non-interconnected zone (NIZ), which corresponds to 52% of the territory of Colombia, approximately 92% of the electrical energy is generated by thermal plants with diesel generators, ...
