Rattan refers to a group of climbing palms found primarily in Southeast Asia. It is a fast-growing vine that has a flexible, woody stem. Rattan is often confused with bamboo, but unlike bamboo, rattan is not ...

Rattan is a natural material derived from a flowering plant belonging to the palm family, predominantly found in Southeast Asia, with some presence in Africa. It is highly valued for its unique ...

Rattan is a vine-like plant that grows in tropical areas, mostly in Southeast Asia. It climbs up trees in rainforests and can stretch for hundreds of feet. While it may look like wood, rattan is ...

Rattan is a natural material made from several types of climbing palms that are native to tropical regions. The outer bark of rattan is used for caning while the inner section is used for weaving.

Hear about the history of rattan as a material and why it's still so popular today.

Rattan isn't the same as wicker or bamboo, so what is rattan? It's actually a type of climbing or trailing vine-like palm native to tropical regions of Asia, Africa, and Australia.

Rattan is a tough, adaptable vining or climbing plant that thrives in tropical jungle settings. Native to Asia, the vining palm (sometimes spelled ratan) can grow as large as 500 feet ...

Thankfully, the truth is pretty simple: Rattan is a material. Specifically, it's a long-stemmed vine that looks a little like bamboo. Because rattan is often used in wicker furniture, we tend to ...

Rattan, also spelled ratan (from Malay: rotan), is the name for roughly 600 species of Old World climbing palms belonging to subfamily Calamoideae.

Rattan is a type of climbing palm that grows in tropical regions. It has a strong, flexible stem that can be easily
