Explore the future of solar in 2025--key trends, new tech, and policies driving global clean energy growth.

On current growth trends, solar is on track to deliver over half of all the world's energy within the next 10 years, in what we must surely now call The Solar Decade (2025 to 2035)!

Statkraft is forecasting that solar PV will become the largest source of power generation from 2035.

The past decade was transformative for solar, with rapid cost reductions and subsequent increases in deployment. It is now possible to envision--and chart a path toward--a future where solar provides ...

The report specifically analyzes the current development status of solar power, as well as both onshore and offshore wind power, and makes seven recommendations for accelerating their ...

Solar PV accounted for approximately 56% of the total installed renewable capacity in 2024, a share that is expected to grow steadily through 2035. Wind energy, which made up 33% of the mix, holds the ...

The Solar Futures Study explores potential pathways for solar energy to drive deep decarbonization of the U.S. electric grid by 2035, and envisions how further electrification could decarbonize the broader ...

Driven primarily by declining costs and strong policy support, particularly for solar PV and wind energy, the global renewable power installed ...

Renewables, led by solar, are still projected to go from one third of global power generation in 2024 to just under half by 2035 under the CPS ...

The increase in solar PV capacity is set to more than double over the next five years, dominating the global growth of renewables. Low costs, faster permitting ...
