Data on renewable power capacity represents the maximum net generating capacity of power plants and other installations that use renewable energy sources to produce electricity.

Wind installations in the United States produced 45.9 terawatt-hours (TWh) of electricity in March 2024, compared with 38.4 TWh from coal-fired power plants. In April 2024, coal-fired ...

Annual electricity generation from wind is measured in terawatt-hours (TWh) per year. This includes both onshore and offshore wind sources.

A record-breaking 117GW of new wind energy capacity was added globally in 2024, according to the latest Global Wind Report from GWEC. Despite this impressive ...

The world's installed wind power capacity now meets well over 10% of global electricity demand - and much more than nuclear power. More than 30 countries now have a share of wind ...

Solar and wind generation combined grew by more than 400 terawatt hours, which was more than overall global demand increased in the same ...

The rapid deployment of renewable energy is exposing the inadequacies in electricity market design. The phenomenon garnering the most attention is the increase in instances of negative power prices, ...

According to the report, wind electricity generation increased by a record 265 TWh (up 14%) in 2022, reaching more than 2 100 TWh - with China ...

In 2024, the total wind power capacity installed worldwide surpassed 1.1 terawatts, growing by more than 100 gigawatts in comparison to the previous ...

The number of wind power equipment generating hours has increased
