Those are high temperatures, you can get a better idea by looking at the normal operating temperature ranges. You better get either a closed loop water cooling or a bigger heatsink with better fan.

Discussion on troubleshooting HWMONITOR issues in Yosemite, including missing CPU temperatures, voltages, and fan speeds.

Hi, I have and Asus Vivobook (X556UV) with high sierra. But my laptop stay always at 80°C; (With no program active) and arrive at 95°C;... the cpu-fan is off...

I bought a second-hand Ryzen 7 5700g for \$115 from eBay. Will be interesting to see how this 8-core/16-thread CPU/APU behaves in macOS. Already running Windows 11 on an Asus TUF ...

Hi, I am new in Hackintosh. I just completed the windows 10 installation on my dual boot system, and I noticed something, the GPU idle temperature on Catalina was much higher than on my ...

Marvell Scalable mGig controllers integrates the following key features of Energy Efficient Ethernet (EEE), Precision Time Protocol (PTP)/1588v2, Synchronous Ethernet (Sync-E), a hardware-security ...

Just after boot CPU's temperature hangs around 50c, but with time, even when idle, it can reach up to 80c.

However, there is a slight hike in temperature, which in reality might also lead to the TDP limits explained in 3). With regards to overclocking, I recall that the U-series chipsets have their max ...

After installing the HW Monitor on my 10.9 built I noticed that the PCH Die temperature is far to high on computer idle or load it stays at 127 Degrees Celsius. The main board is brand ...
