In all cases in which a custom signal handler was registered, the process transitions to an uninterruptible sleep state when a signal for this custom handler is scheduled; leading to no other ...

Uninterruptible Sleep usually caused by I/O, sometime it's caused by I/O trashing because of low memory. Only by looking your perfetto trace can figure it out.

I have a VirtualBox process hanging around which I tried to kill (KILL/ABORT) but without success. The parent pid is 1 (init). top shows the process as D which is documented as ...

A process performing I/O will be put in D state (uninterruptable sleep), which frees the CPU until there is a hardware interrupt which tells the CPU to return to executing the program. See ...

I'm noticed that process that dumping a core is in uninterruptible sleep, so it can't be killed with SIGKILL, but when I'm trying to emulate this behavior using pipe commands that receives coredump I can ...

In short, making I/O uninterruptible is for the purpose of making the I/O task finish ASAP, without being interfered by signals. Some related knowledge that I gained from the book: The word ...

When looking at the process with `"ps ax"`; the stat column is `"Dl"`; which means `"uninterruptible sleep (usually IO)"`; Is it possible to find out more details on what the process is ...

Another question is, if we enable PREEMPT then the linux kernel become a preemptive kernel so at any place when we are handling a syscall in the kernel mode, it may be preempted so ...

The Uninterruptible state is mostly used by device drivers waiting for disk or network I/O. When the process is sleeping uninterruptibly, signals accumulated during the sleep are noticed when ...
