Learn what causes noise from wind turbine blades, its health effects, regulations, and how low-noise models help to reduce noise pollution.

Discover proven strategies for noise mitigation for turbines to improve community health and acceptance.

What kinds of noise do wind turbines produce? Wind turbines most commonly produce some broadband noise as their revolving rotor blades encounter turbulence in the passing air. Broadband noise is ...

Low-frequency (20-200 Hz) noise (LFN) from wind turbines has received much public attention due to potential health concerns. This work tries to estimate the sound power level of wind turbines (LW,A ...

First, an estimate of the project area's existing soundscape is necessary in order to predict the impact resulting from a proposed project, including other nearby wind projects or other notable sources of ...

This paper discusses various noise generation mechanisms in wind turbines and potential noise reduction techniques. Special emphasis has been laid on reviewing aerodynamic noise ...

The noise of a wind turbine is a function of its distance and the surrounding environment. At a distance of 300 meters, a wind turbine puts out ...
